Active Transportation Plan

Credit: WSU

Overview

An Active Transportation Plan is a strategic blueprint designed to support, enhance, and expand active modes of transportation, such as walking, biking, and other non-motorized forms of travel. These plans are essential for creating accessible, safe, and connected transportation systems that support community health, sustainability, economic growth, and equitable mobility. Active transportation infrastructure can include bicycle lanes, sidewalks, trails, crosswalks, and other amenities that encourage physical activity and reduce vehicle reliance. As demand grows for alternative transportation options, Active Transportation Plans are becoming increasingly important to accommodate the shift towards sustainable, community-driven transportation solutions.

WAMPO's Vision

The Wichita Area Metropolitan Planning Organization (WAMPO) is developing a comprehensive Active Transportation Plan to meet the evolving transportation needs of communities in the WAMPO region. Recognizing the significant community interest in active transportation and sustainability, WAMPO's vision for the plan centers on increasing connectivity, promoting health, and enhancing safety for all residents, regardless of age or ability. The plan aims to address barriers to safe non-motorized travel and create cohesive infrastructure that spans municipalities within the region.
